Creating an Image for our Platforms

Building Android BSP Images

Building Android BSP Images

- ⚡ If built with only **4**, the build will succeed, but board will fail to boot.
- ⚡ If built with **2** and **4**, the build will fail.
- ⚡ If customer builds with all 4 components, a fully working set of binaries can be generated.

Note: Most boot loaders/meta-binaries are proprietary and are thus provided as directly flashed on to the board. These are not provided as source.

Building Debian Linux BSP Images
